

Each point from the meeting, and what changed

Every item raised in the review is addressed in the live version. The right-hand column says what a user sees now.

FEEDBACK	WHAT CHANGED
Internal material was visible: ratings, question numbers, rankings such as "29th of 31", the internal analysis, test figures.	Removed everywhere. Answers, sources, exports and screens show only what companies disclosed publicly. An automated test scans every answer for internal terms. Requests for a score or rating are declined politely.
Answers were stretched. A basic question came back with peer charts and tables.	Pinpoint answers. A plain question gets the figure asked for and the previous year, in two or three sentences. Comparisons and charts are offered as one-click follow-ups instead of being added unasked.
Scope 1 and Scope 2 were added together.	Always two separate figures, with the combined total shown alongside.
The lens did not work, and there was a separate company search bar.	Fixed and renamed "Your company". It failed on most natural phrasings ("my emissions", "who are my peers", "how am I doing"); 21 phrasings are now tested. The separate search bar is gone.
Peers showed every parameter at once.	"Who are my peers" is a list of names. A comparison is one small table against the peer median, with no ranks or percentiles.
Services showed 31 companies, not 35.	The sector has 35 companies; 31 disclosed Scope 1 and 2. Answers now give the full count and, separately, how many disclosed each figure.
Previous chats were hard to reach when many accumulated.	Sidebar laid out like ChatGPT: New chat, Search chats, then a chat list grouped by date that fills the remaining height and scrolls on its own. Chats can be renamed and deleted.
Too much on screen: "E1 intelligence", "597 of 597", Method and sources, both Ask and New question.	All removed. One "New chat" button and a plain home screen.
No infographic support.	Added for a company, a sector or all companies, downloadable as an image.
Excel and PDF downloads leaked internal columns; units such as tCO2 were garbled across cells.	Exports rebuilt. Real Excel files with numbers in cells and units in the column headers. The PDF holds only the answer and its public sources.
Wording such as "beats X% of peers".	Neutral wording throughout, for example "below the peer median".

Also found and fixed: ONGC was wrongly reported as "not covered". It is in the data and now answers normally.

Ask in your own words, get the figure

Set your company once. After that, "we", "our" and "my company" mean that company, and a question with no company named is answered for it.

"what are scope 1 and scope 2 emissions" Two figures, never a single sum. With no company set, the same question returns a one-paragraph definition of each term.

"who are my peers" Names only. The count is the full sector: 35 companies including TCI Express.

"how do we compare with our peers" One table against the peer median. "Peers disclosing" shows how many of the 34 peers reported each figure.

Also answered

- **Targets and projects**, shown exactly as the company filed them, with the most specific points highlighted.
- **Examples from other companies**: three detailed disclosures from the sector, in their own words.
- **Company against company**, up to six side by side.
- **Sectors**: totals, the largest emitters, and all 22 sectors compared.
- **Lists and counts**: "which cement companies do not have assurance", "how many companies report Scope 3".
- **Search**: "which companies mention green hydrogen".
- **What-if**: "what if we cut Scope 1 by 20%", with a slider.
- **Definitions**: Scope 1, 2 and 3, intensity, BRSR.

If something is not covered (water, energy, financials, forecasts, scores), the answer says so plainly and offers what is available.

Share it as an image, a spreadsheet or a PDF

"Make an infographic of our emissions" produces a post-style image. The same data always produces the same picture, and it follows the light or dark theme.

Company. Figures by scope, the change from last year, four disclosure checks and one sentence in the company's own words.

Sector. Totals, the five largest emitters and the share of companies reporting Scope 3, assurance and projects.

All companies. The same layout across all 982 companies and 22 sectors.

Excel

Every answer, table and chart has an Excel button. The file is a real workbook, not a text export.

Answer sheet	The question and the answer in words
Figures sheet	Company, disclosure item, financial year, value as disclosed
Data sheets	One per table or chart, with a title, a source line and a frozen header row
Units	In the column header, for example "Scope 1 (tCO ₂ e)". Cells hold plain numbers that sort and sum.

PDF

The PDF button lays the answer out for an A4 page: the question, the answer, charts sized for paper, and the numbered list of sources. It always prints in the light palette, even from dark mode.

What a source looks like

Company name · BRSR filing · financial year · the disclosure item (for example "Total Scope 1 emissions") · the value exactly as disclosed. Calculated figures show the arithmetic and the disclosed figures used.

Laid out like the chat tools people already know

Chats. New chat and Search chats at the top; the list is grouped by date and scrolls on its own, so earlier chats are always reachable. With a company set, the suggestions are phrased as "our".

Your company. One place to set it, from the button under the question box. It is saved only in the browser. Saying "my company is Blue Dart" works too.

Dark mode and comparisons. Every text element is checked against what is rendered behind it: 54 screens across light and dark pass at a contrast of 4.5:1 or better.

Mobile. The same answers on a phone.

Remembers within a chat

Follow-ups such as "and Scope 3?" keep the company. A chat can be told "my peers are ACC, Ambuja and Shree Cement" or "always show the top 5".

No sign-in

Chats and your company stay in the browser. The server keeps only anonymous question text and timing, plus feedback a user chooses to send.

Asks when unsure

"Adani" or "TCI" match more than one company, so the tool asks which one. A company that is not covered is named as such, never substituted.

Looked up and calculated, never made up

A small model, trained from scratch for this purpose, only works out what kind of question is being asked. The answer is then calculated from the disclosed figures and written from fixed sentence templates, so it cannot contain an invented number.

What the 246 tests cover

- No internal term in any answer, source or export, with and without a company set.
- 21 ways of saying "my company" resolve correctly; market questions stay market questions.
- Simple questions return no charts and at most three sentences.
- Scope 1 and Scope 2 are separate figures.
- No rank or percentile wording in peer answers.
- Every numeric sentence has a source, and every source resolves.
- The same question gives a byte-identical answer.
- Export headers carry the units; cells are numbers.

Known limits

- Covers GHG emissions and climate disclosures. Other topics are answered with "not available yet", ready for more parameters to be added.
- Figures are shown as disclosed. A few appear to be in a different unit (Tata Steel's Scope 1 is filed as 61 tCO₂e); these carry a note and are left out of comparisons and totals.
- Sector classification is taken from the source data as is. A few entries look wrong (Hindustan Unilever under Metals & Mining, Hindalco under Services).
- The live site is on a free server that sleeps when idle, so the first visit after a pause is slow while it wakes.
- The free database expires after 30 days. The tool keeps answering; stored feedback and share links would be lost.

For the team only. How a question was routed, usage counts and data checks are available through token-protected pages and are never shown in the product. Details are in the repository README.
